ANT SECURITY LAB

Introduction

Shijie Cao: The security researcher in TianChen Lab of Ant Group. He has been engaged in mobile/IoT security for 6 years and focuses on researching mobile security architecture construction and application vulnerability fuzzing. During the past year, his research has been on automated vulnerability fuzzing on mobile applications and IoT, and hundreds of security vulnerabilities have been discovered.

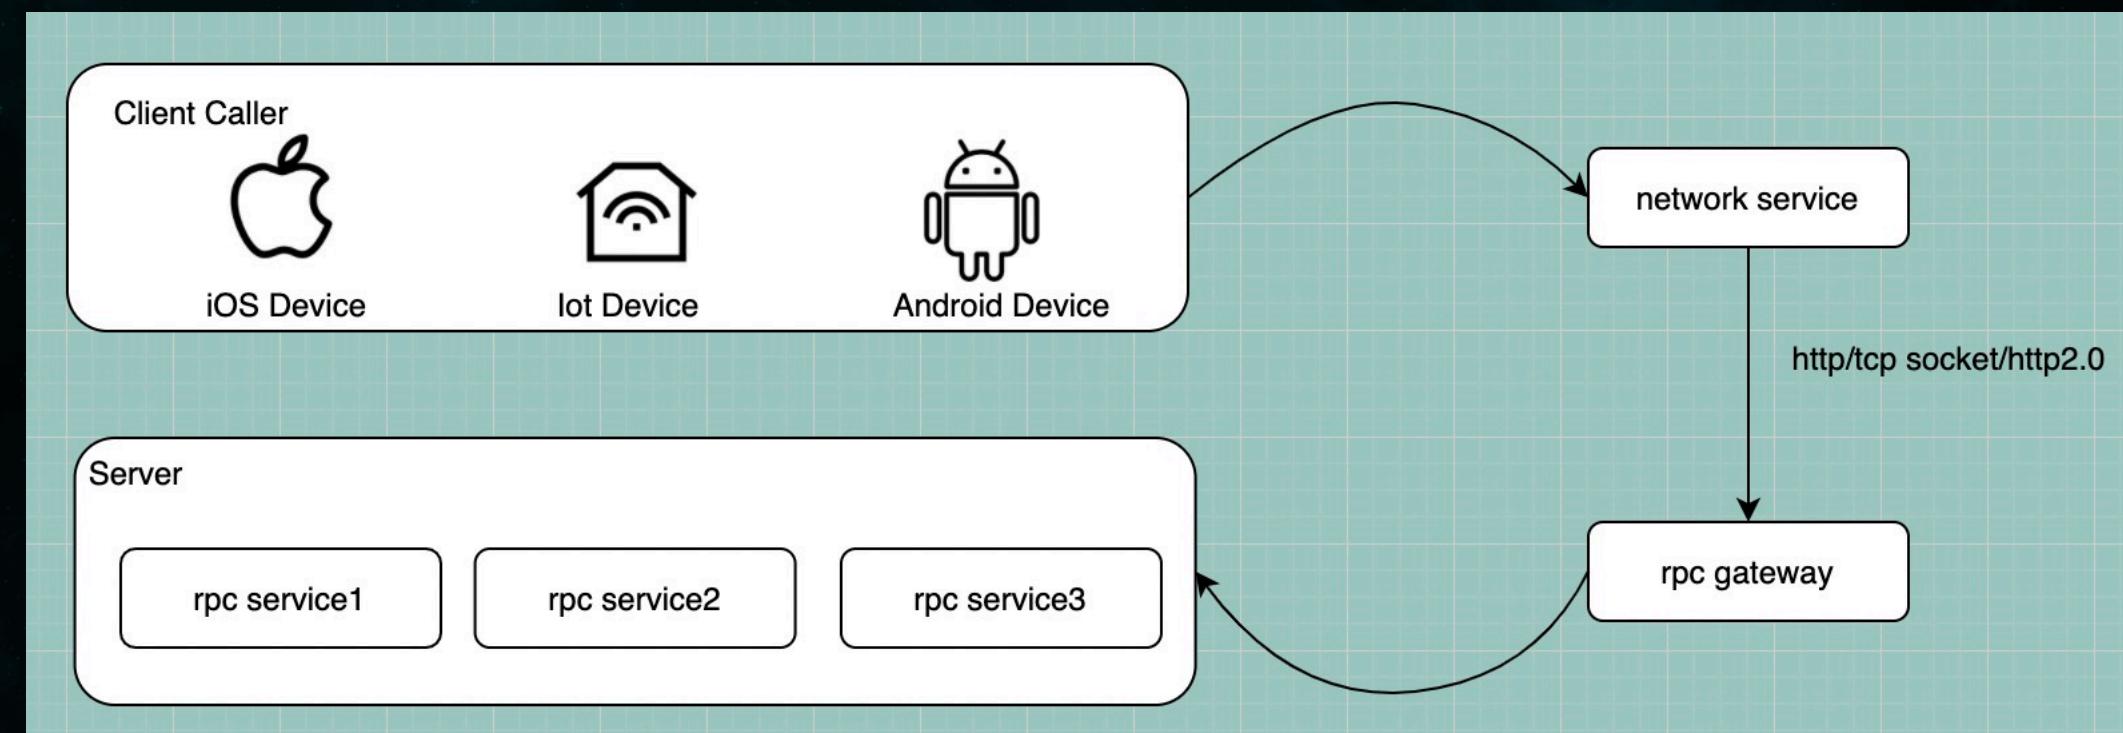

Hao Zhao: The chief mobile security architect at Ant Group and the founder of Ant Group Frontage Security Lab. He has more than 8 years of experience in mobile and IoT security research. He is also responsible for Ant Group's client security defense building. He has shared many of his research results at Black Hat and RSAC.

What is RPC protocol

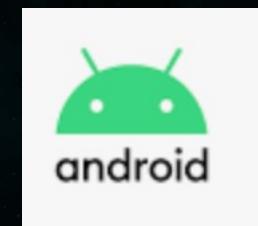

RPC is Remote Procedure Call.

Features: No need to attention network information, such as IP, port, etc., only need to pay attention to the interface name, parameters, you can get remote services .

Features of gRPC

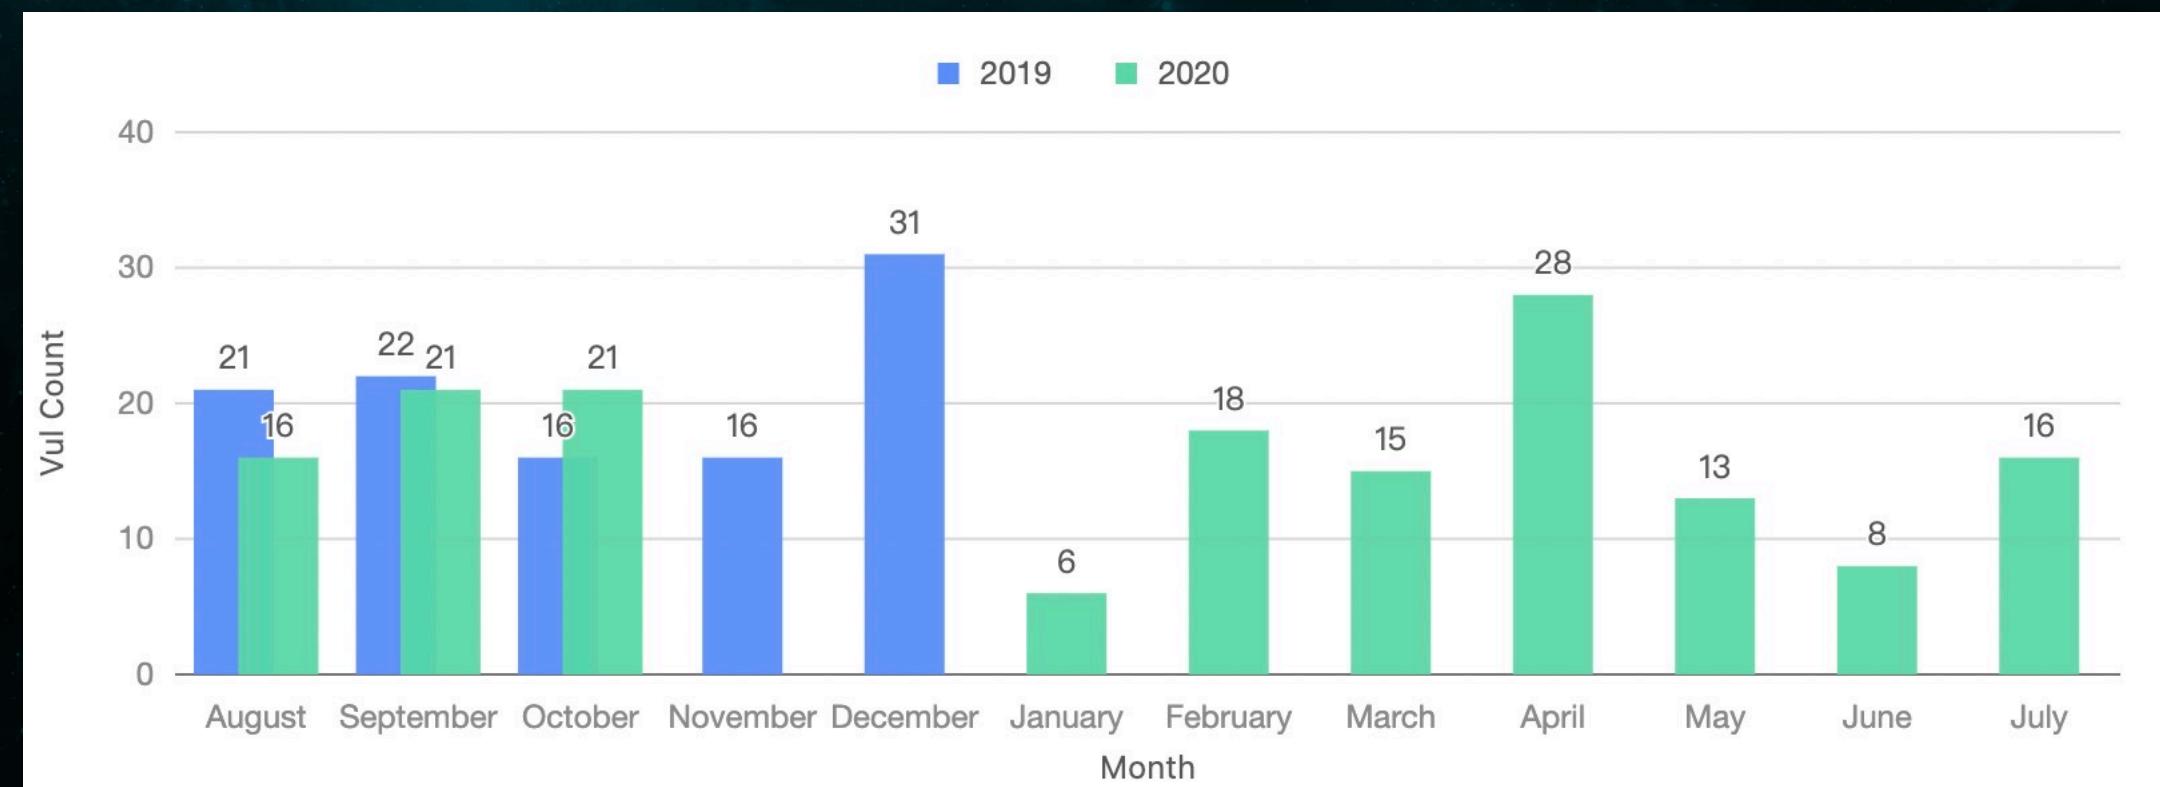

Feature 1: Can run on different platforms

Feature 2: Based on Http2.0, the network overhead is small and the expansion is higher.

Feature 3: Use Proto3 as a universal open source RPC architecture for IDL and transmission data format(Also compatible with proto2).

Statistics on the number of vulnerabilities in mobile App & IoT App based on gRPC protocol we found in the past.

Perspectives of different roles

1. From the developer's perspective, it is believed that the application of encryption, serialization, environmental verification, signature and other methods at the application level is relatively safe, and thus lacks a union defense system for the mobile application and the cloud.
2. From the attacker's perspective, although the application will have various security mechanism to ensure the communication security, since most of the security mechanisms act on the client, once bypassed, it opens the door to app-to-cloud attacks.

How to build a vulnerability mining platform based on grpc protocol

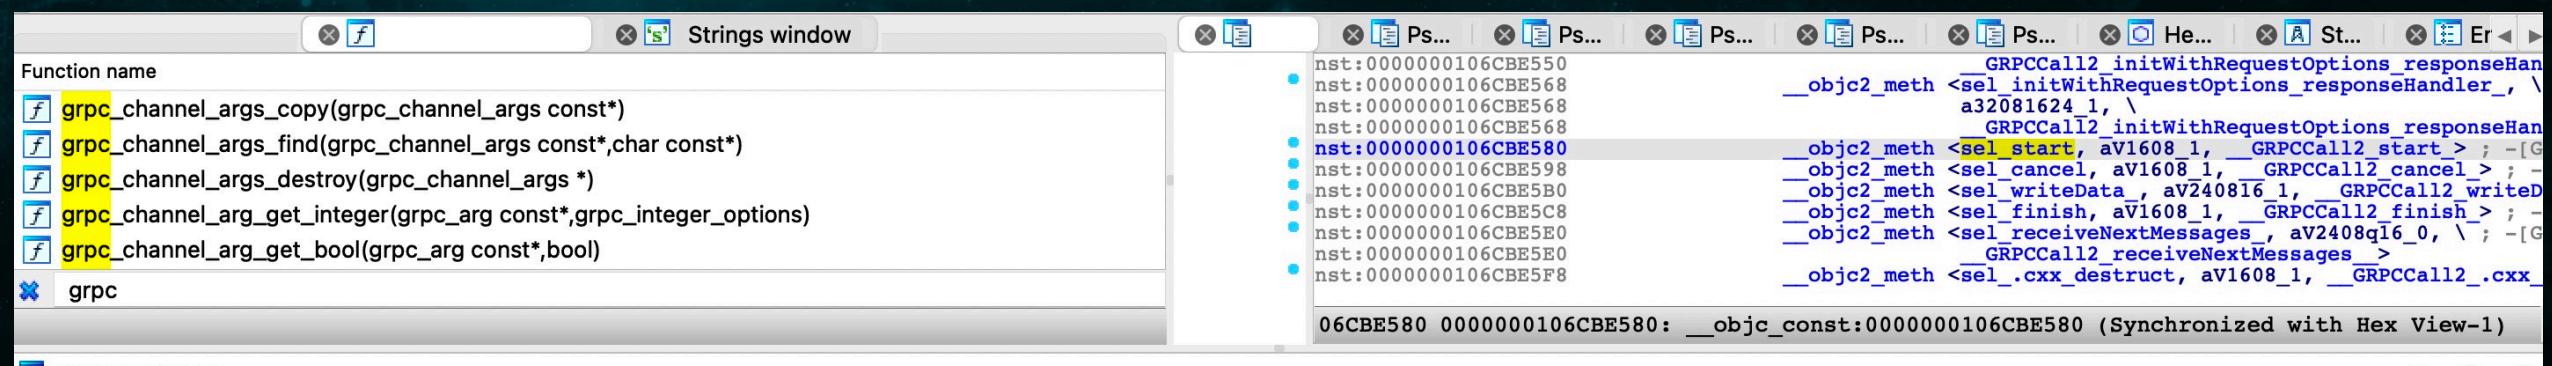

Grpc protocol vulnerabilities mining
technical barriers :

1. Obtain the original data of gRPC on the app and have the ability to replay gRPC data
2. Vulnerability analysis and performance improvement of different grpc requests
3. Arsenal construction

How to build a vulnerability mining platform based on grpc protocol

1. Understand and control the operating logic of gRPC in the application

The screenshot shows a debugger interface with several windows:

- Strings window:** Shows function names like `grpc_channel_args_copy`, `grpc_channel_args_find`, `grpc_channel_args_destroy`, `grpc_channel_arg_get_integer`, `grpc_channel_arg_get_bool`, and `grpc`.
- Memory dump window:** Displays memory addresses and their corresponding values, including `__objc2_meth <sel_initWithRequestOptions_responseHandler_` and `__objc2_meth <sel_start, av1608_1, __GRPCCall12_start_>`.
- Output window:** Shows the command history used for analysis, including `bin2rela - design by shijie.csj`, various `push` and `trace method` commands, and `pop` and `store` operations.

```
Function name
f grpc_channel_args_copy(grpc_channel_args const*)
f grpc_channel_args_find(grpc_channel_args const*,char const*)
f grpc_channel_args_destroy(grpc_channel_args *)
f grpc_channel_arg_get_integer(grpc_arg const*,grpc_integer_options)
f grpc_channel_arg_get_bool(grpc_arg const*,bool)
* grpc

06CBE580 0000000106CBE580: __objc_const:0000000106CBE580 (Synchronized with Hex View-1)

```

Automatic analysis grpc relation (use push & pop trace)

How to build a vulnerability mining platform based on gRPC protocol

1. Understand and control the operating logic of gRPC in the application

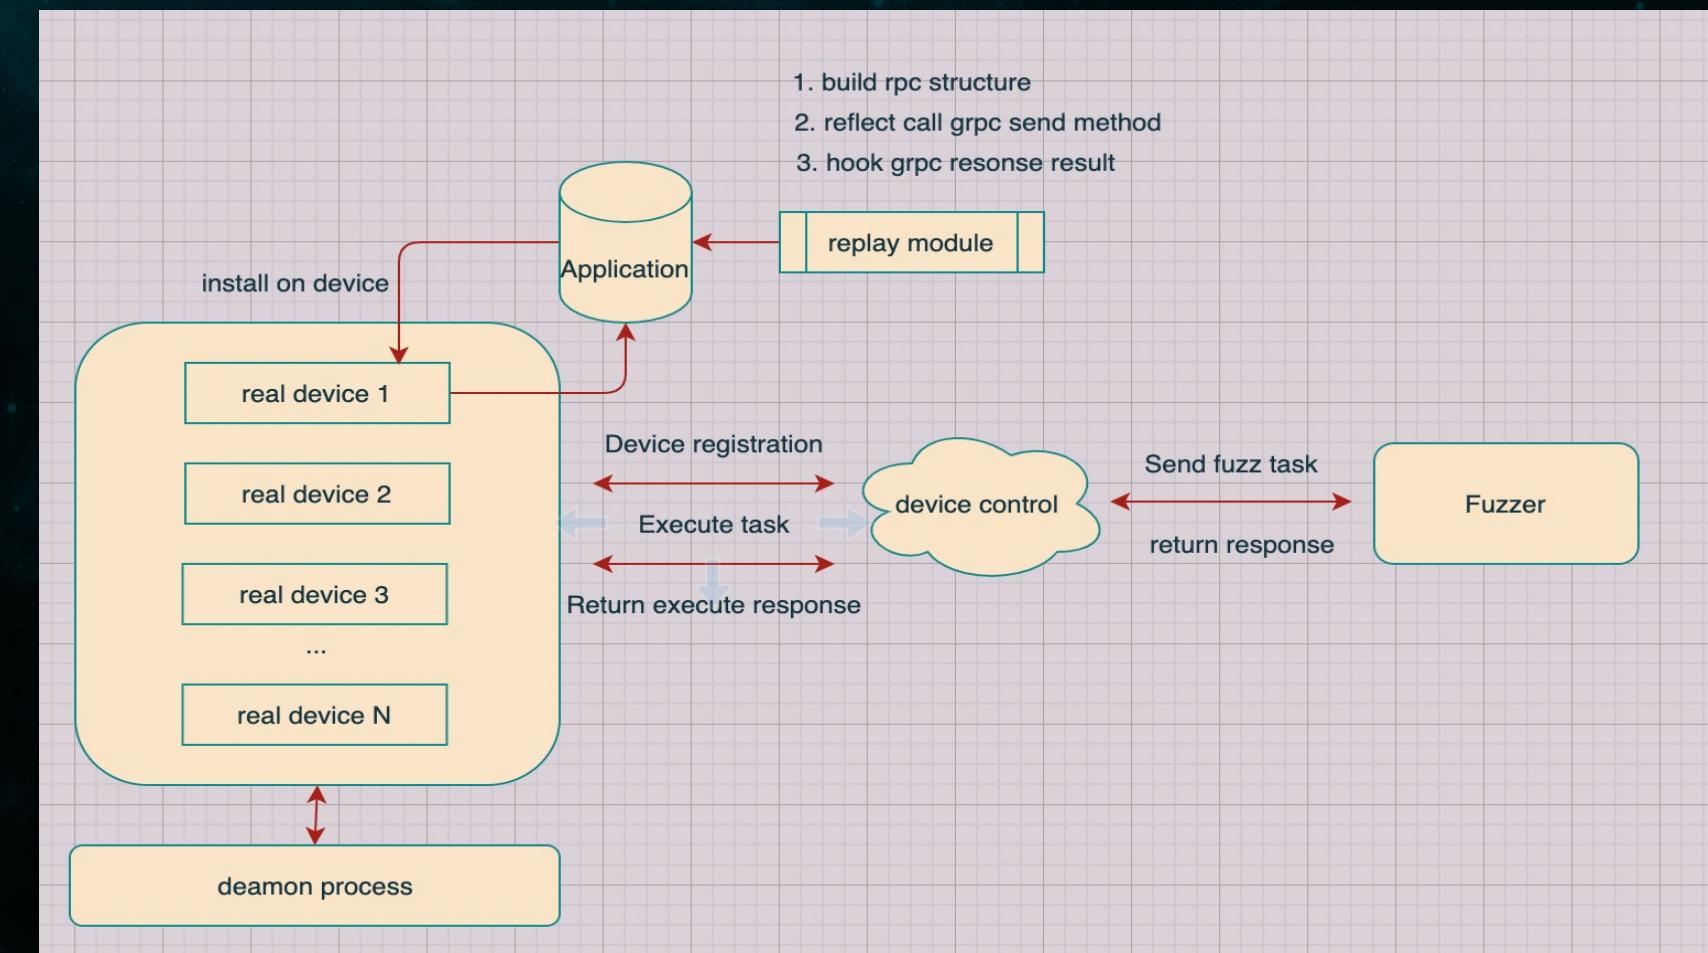

Understand the operating mechanism and interception methods of gRPC

How to build a vulnerability mining platform based on gRPC protocol

1. Understand and control the operating logic of gRPC in the application

```
Client Heartbeat package :  
client = GRPCAgent.instance  
client.worker = nil;  
client.platform = @"iOS/Android";  
client.isHeartBeat = True;  
client.isRun = FALSE;  
client.taskLock = Object;
```

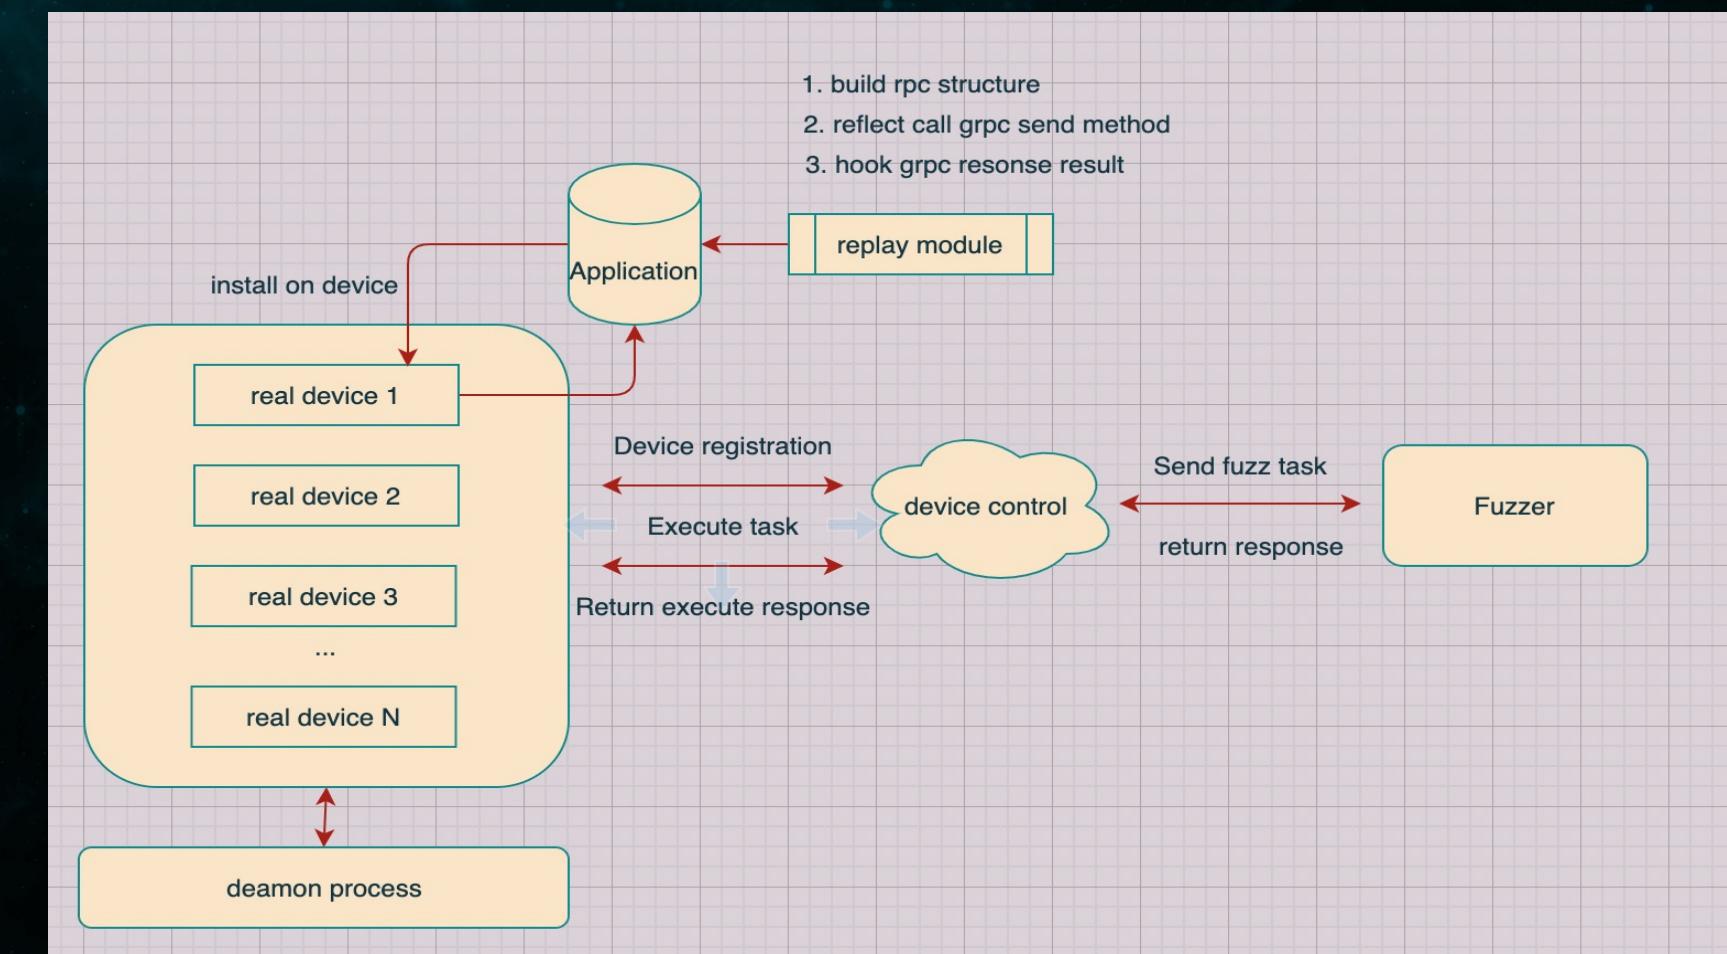

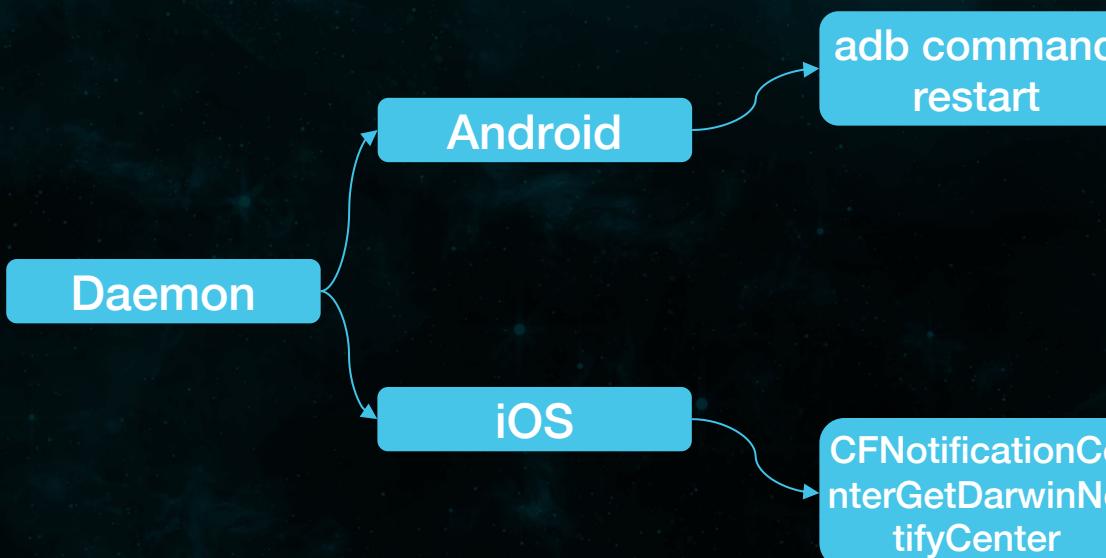

```
Server Side register :  
executor_info = {  
    'tenant': device_tenant,  
    'did': device_id,  
    'type': device_type,  
    'name': device_name,  
    'cluster': device_cluster,  
    'others': device_others,  
    'last_update': now,  
    'metrics': mobilegw_pb2.DeviceMetrics(),  
    'last_sync_timestamp': now,  
    'task_runner': 0,  
    'app_version': device_app_version,  
    'hook_version': device_hook_version  
}
```

Replay ability construction

How to build a vulnerability mining platform based on gRPC protocol

1. Understand and control the operating logic of gRPC in the application

Replay ability construction

How to build a vulnerability mining platform based on grpc protocol

1. Understand and control the operating logic of gRPC in the application

```
def getLoginState(self,appid):
    try:
        if appid == 'mobile application 1' and appid in self.loginConf.keys():
            tid = self.loginConf[appid]
            result = self.replayPlatform(appid, False, "gRPC.method.1", json.loads(tid))
            result = result.decode('utf-8')
            result = json.loads(result)
            print(result['sessionId'])
            return 'SESSIONID=' + result['sessionId']
        if appid == 'mobile application 2' and appid in self.loginConf.keys():
            tid = self.loginConf[appid]
            result = self.replayPlatform(appid, True, "gRPC.method.2", tid)
            result = protobuf().parse(result)
            all_value = data2dic_obtain_all_value(json.loads(result))
            for v in all_value:
                if type(v) == str and v.find('SESSIONID=') != -1:
                    v = json.loads(v)['set-cookies'][0].split(';')[0]
                    return v
        if appid == 'Iot device 3' and appid in self.loginConf.keys():
            tid = self.loginConf[appid]
            result = self.replayPlatform(appid, True, "gRPC.method.3", tid)
            result = protobuf().parse(result)
            result = result.replace('\"\\\"', '\"').replace('\"[', '[').replace('\"{', '{').replace('\"}', '}').replace('\\\\\\\", \'')
            all_value = json.loads(result)
            cookies = None
            for v in all_value:
                if type(all_value[v]) == dict:
                    for k in all_value[v]:
                        if type(all_value[v][k]) == dict:
                            c = all_value[v][k]
                            if 'cookies' in c.keys():
                                cookies = c['cookies']

            cookie = ''
            for k in cookies:
                if k == 'SESSIONID':
                    cookie += 'SESSIONID=' + cookies[k]
    
```

AutoLogin ability construction

How to build a vulnerability mining platform based on grpc protocol

gRPC Fastjson RCE

How to build a moat for gRPC applications

You can't just rely on the security protection mechanism on the mobile app, the server needs supporting infrastructure to build its own moat

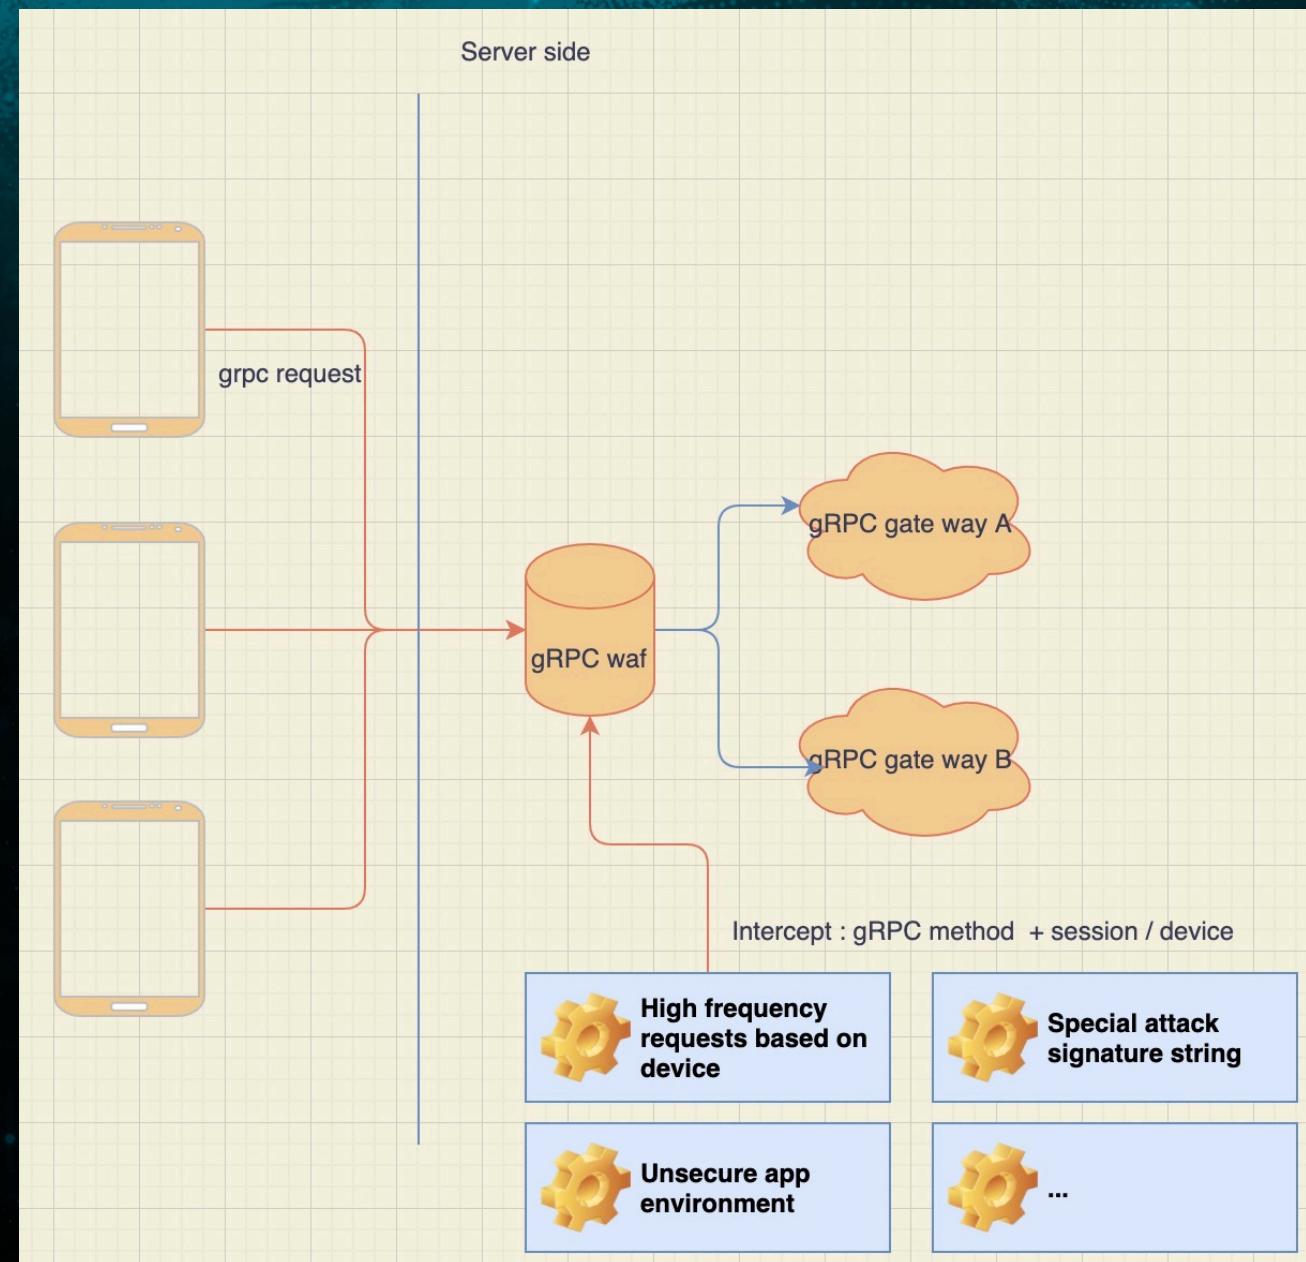

This kind of risk confrontation is not a single defense capability, but a systematic construction of the defense-in-depth capability of the server side.

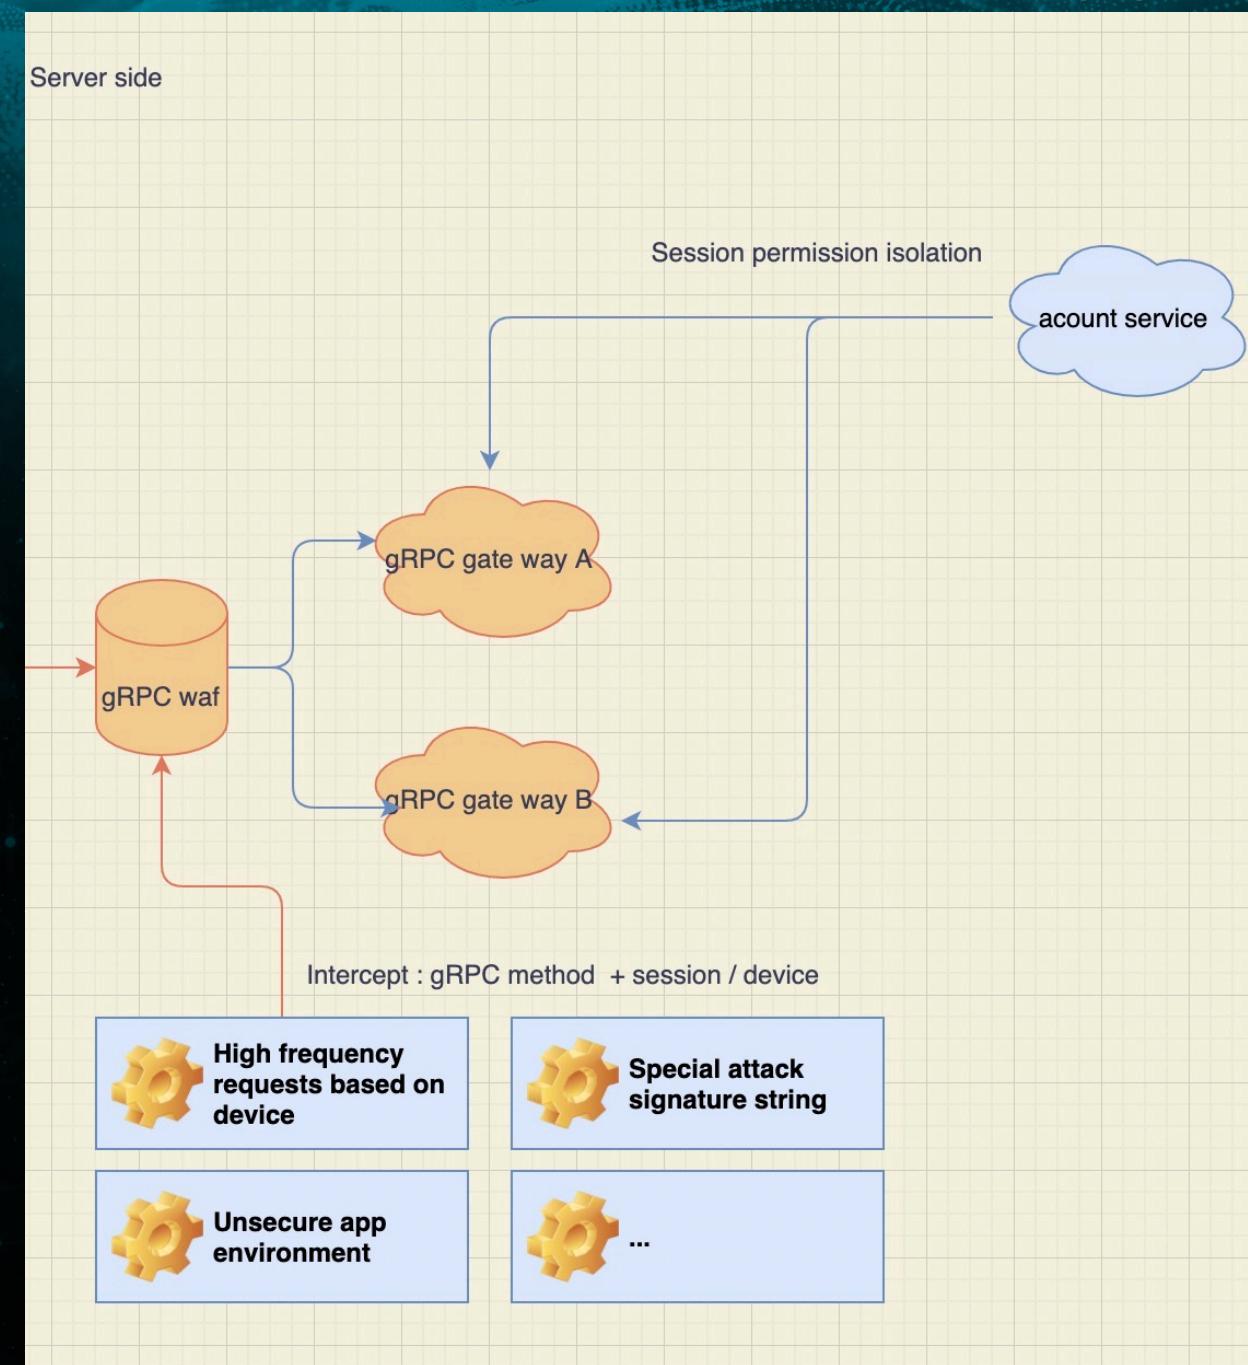

(Every piece has vulnerable.)

(Defense in depth: no vulnerable)

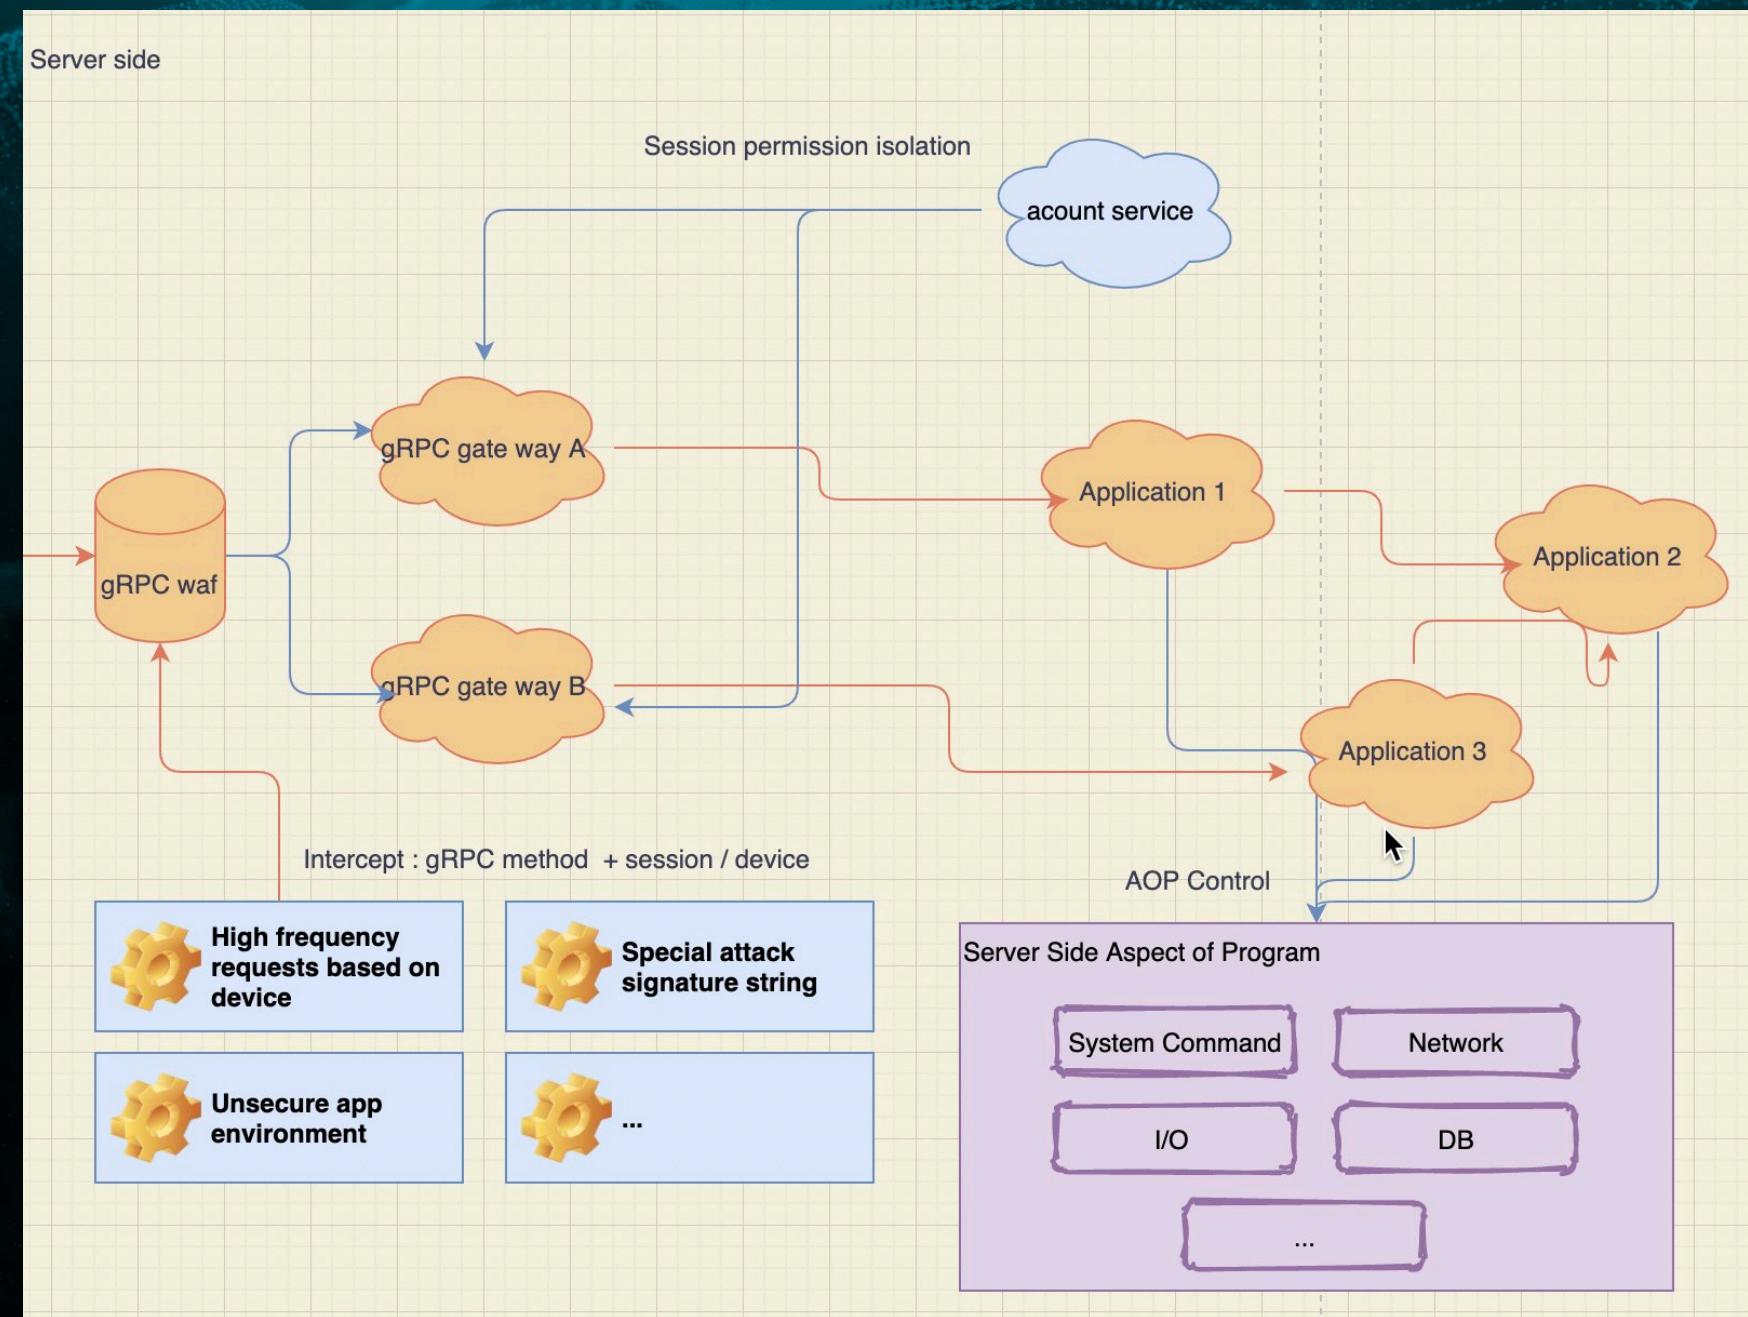

Waf based on gRPC network environment

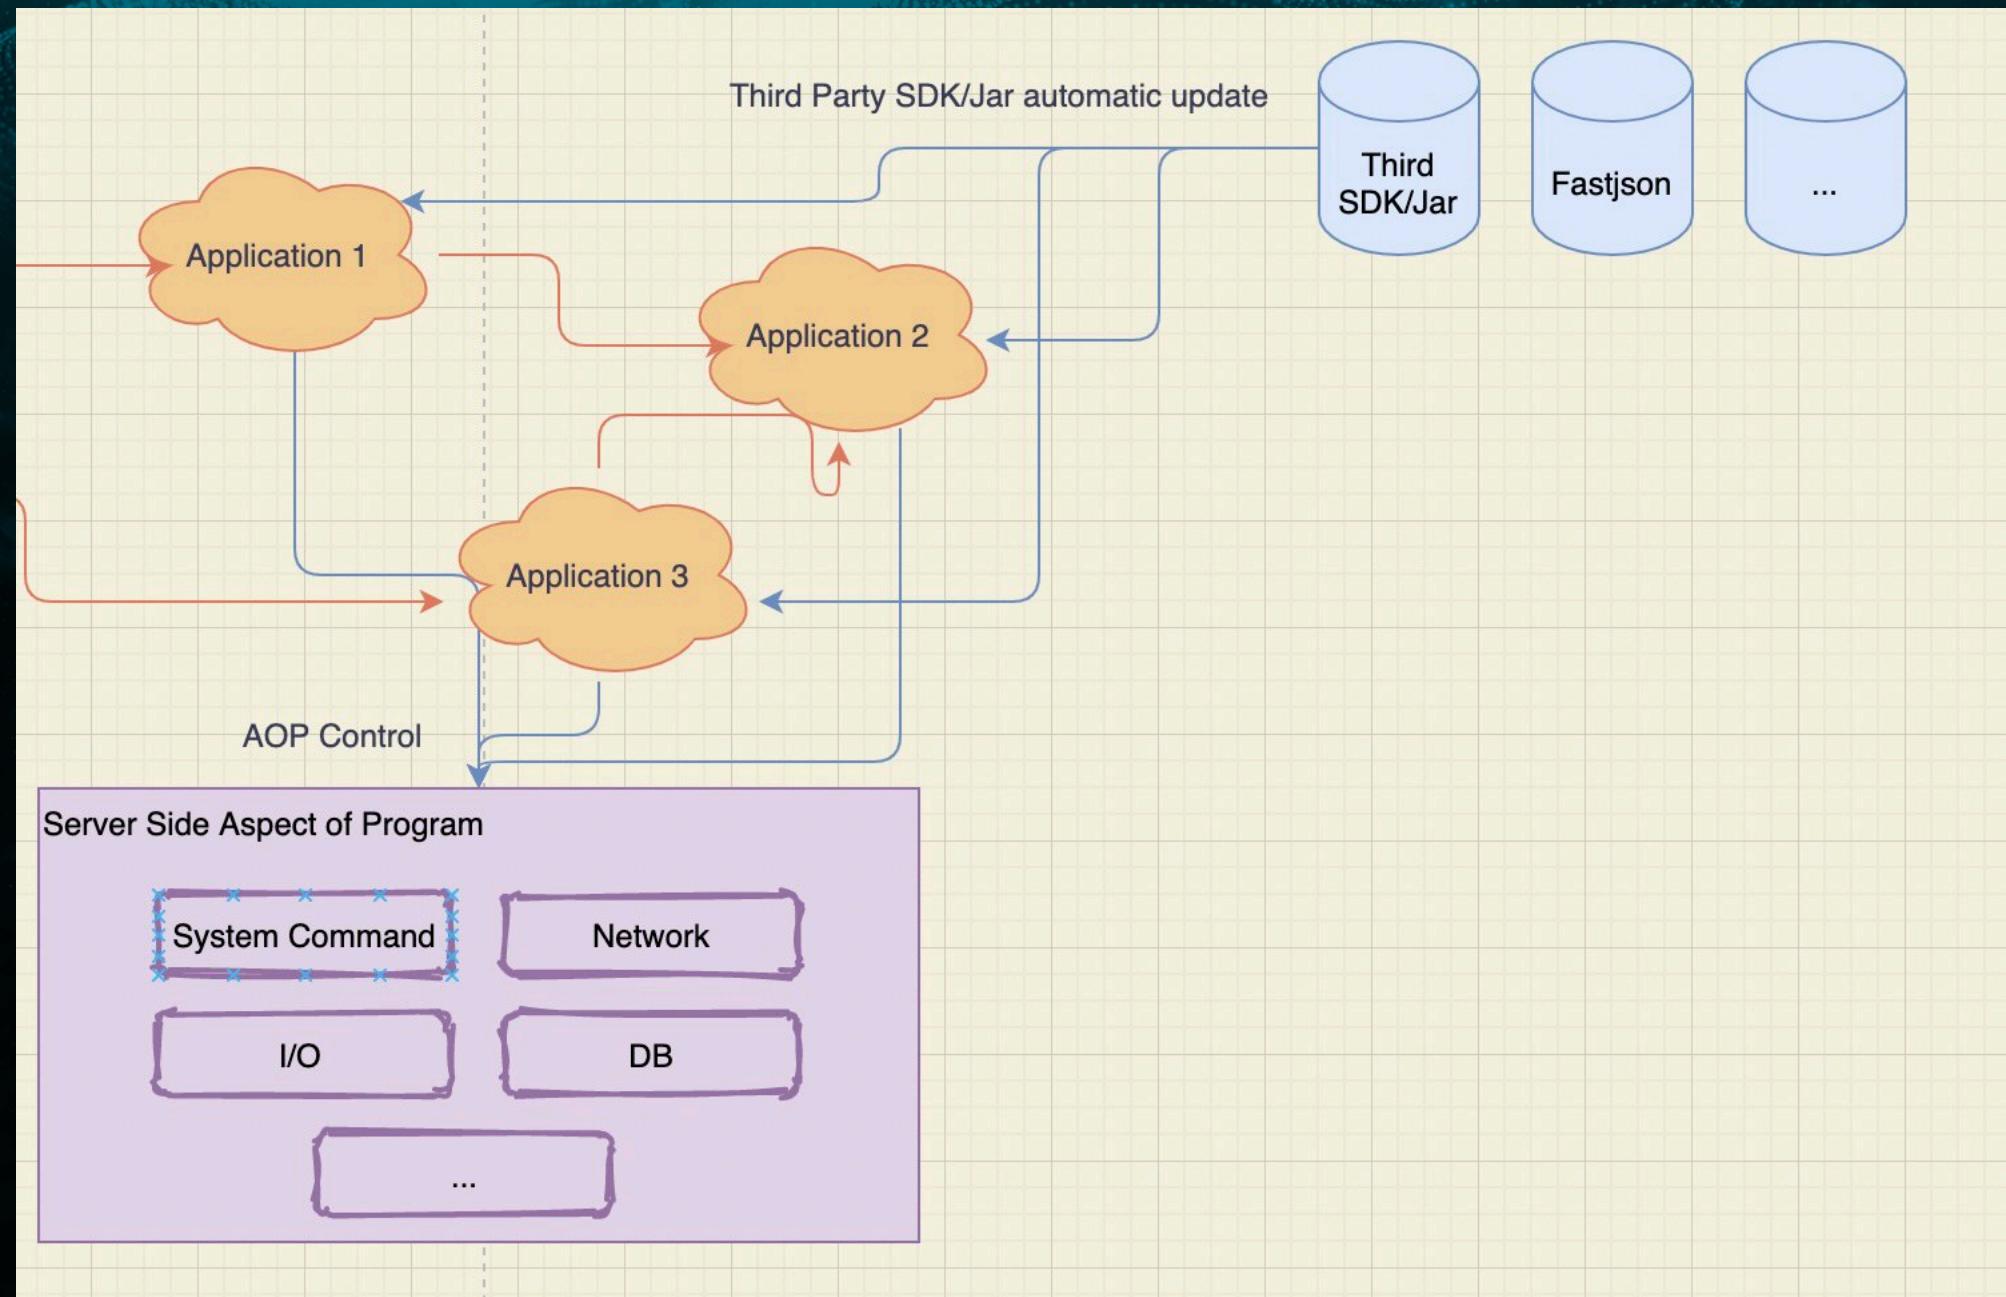

Cookie isolation for different applications

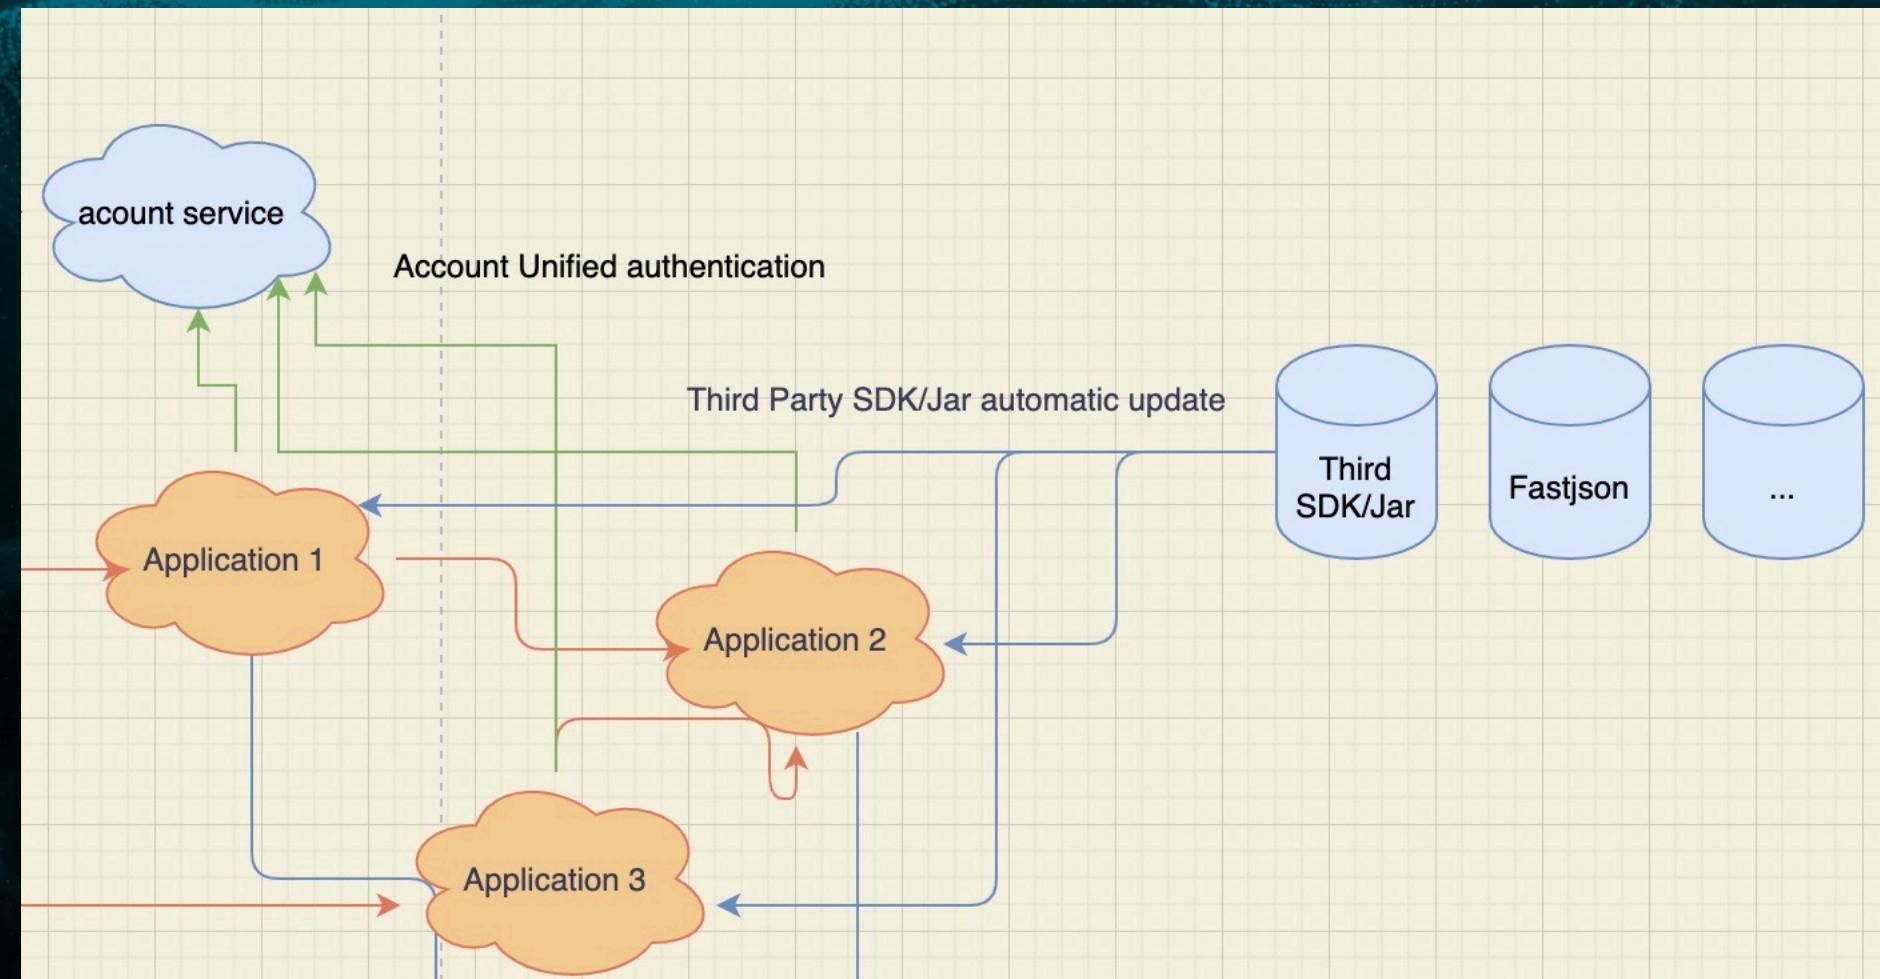

Server-side aspect defense system

Supply chain (Third Part SDK/Jar) automatic update

Unified authentication of account identity

Summary

1. In the era of mobile Internet, a large number of services rely on the gRPC protocol for data exchange. There is a huge attack surface in the middle.
2. With the rapid development of the Internet, the gRPC protocol has become the basis of network protocols facilities , need supporting defense facilities to avoid external network security risks.
